This product meets the requirements set by the Customs Union of the Republic of Belarus, the Republic of Kazakhstan and the Russian Federation.

READ THESE INSTRUCTIONS FIRST!

These instructions provide information about safe handling and operation of the valve.

If you require additional assistance, please contact the manufacturer or manufacturer's representative.

SAVE THESE INSTRUCTIONS!

Addresses and phone numbers are printed on the back cover.

1. GENERAL

1.1 Scope of the manual

This manual provides essential information on series GU, Globe-Unbalanced single seated sliding stem globe valves. Actuators and positioners are only discussed briefly. Refer to the individual manuals for further information on their installation, operation and maintenance.

NOTE:

Selection and use of the valve in a specific application requires close consideration of detailed aspects. Due to the nature of the product, this manual cannot cover all the individual situations that may occur when the valve is used.

If you are uncertain about use of the valve or its suitability for your intended purpose, please contact Valmet for more information.

For valves in oxygen service, please see also the separate installation, maintenance and operating instructions for oxygen service (see Neles document id:10O270EN.pdf).

1.2 Valve construction

Series GU, Globe-Unbalanced valves are flanged (weld end available) single seated sliding stem control valves. The valve seat ring and retainer and plug with stem is a module accessible through the bonnet opening (top entry) of the body.

Our standard design provides a top guide with a contoured plug with a quick change seat ring. The solid top (retainer) plug boss guiding makes strong support to ensure valve alignment.

This series is available with series of reduced bore trims and the standard seat tightness is class IV, optional trims can meet to class V and VI, ANSI/FCI 70-2.

The detailed structure is revealed by the type code shown on the valve identification plate. The type code is explained in Section 11.

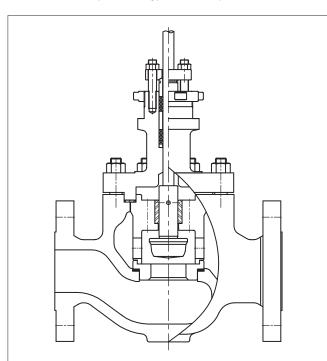

Fig. 1 Neles globe-unbalanced single seated valve

1.3 Valve markings

The body markings are: manufacturer's trademark, nominal size, pressure rating and material of the body. The identification plate is attached on an actuator yoke side.

Markings on the identification plate:

- 1. Type designation (Valve code)
- 2. Size, Rating
- 3. Cv
- 4. Body material
- 5. Plug, Stem material
- 6. Seat material
- 7. Temp. min./max.
- 8. Maximum (shut-off) pressure
- 9. Valve manufacturing date
- 10. Tag No.
- 11. CO No.

Depending on manufacturing location, information on the identification plate may differ.

1.4 Technical specifications

Face-to-face length: ANSI/ISA-75.08.01, 03, 04, 05 &

ANSI/ISA-75.08.06 (Long)

EN 558 series 1

Body rating: Class 150 to Class 2500

PN 10 to PN 250

Max. pressure differential: acc. to pressure class

Temperature range: -196° to +593 °C (depending on the

body materials and bonnet type)

Flow direction: indicated by an arrow on the body

(normally flow to open)

Actuator mounting: threaded bonnet with yoke nut or

bolted yoke

Stem connection: clamp with bolts/nuts
Dimensions: see Section 10
Weights: see Section 10

Note that the max. shut-off pressure is based on the mechanical maximum differential pressure at ambient temperature. You must always observe the fluid temperature when deciding on applicable pressure values. When selecting a valve you must also check the noise level, cavitation intensity, flow velocity, actuator load factor, etc. using Nelprof.

1.5 Valve seat leakage class

The valve follows the seat leakage classifications of ANSI/FCI 70-2 requirement.

1.6 Recycling and disposal

Most valve parts can be recycled if sorted according to material. Most parts have a material marking. A material list is supplied with the valve. In addition, separate recycling and disposal instructions are available from the manufacturer. A valve can also be returned to the manufacturer for recycling and disposal for a fee.

1.7 Safety precautions

CAUTION:

Do not exceed the valve performance limitations!

Exceeding the limitations marked on the valve may cause damage and lead to uncontrolled pressure release.

Damage or personal injury may result

CAUTION:

Do not dismantle the valve or remove it from the pipeline while the valve is pressurised!

Dismantling or removing a pressurised valve will result in uncontrolled pressure release. Always isolate the relevant part of the pipeline, release the pressure from the valve and remove the medium before dismantling the valve.

Be aware of the type of medium involved. Protect yourself and the environment from any harmful or poisonous substances. Make sure that no medium can enter the pipeline during valve maintenance

Failure to do this may result in damage or personal injury.

CAUTION:

Be aware of plug motion!

To avoid personal inquiries resulting from movement of a plug, keep any part of your body, especially fingers out of the flow port. Any tools or any other foreign stuff also must be kept out of this flow ports. During valve maintenance, make sure that air pressure supply line is disconnected to the actuator.

Failure of this may cause personal inquiry and product damage.

CAUTION:

Protect yourself from noise!

The valve may produce noise in the pipeline. The noise level depends on the application. It can be measured or calculated using the Neles Nelprof software. Observe the relevant working environment regulations in terms of noise emission.

CAUTION:

Beware of a very cold or hot valve!

The valve body may be very cold or very hot during use. Protect yourself against cold injuries or burns.

CAUTION:

When handling the valve or the control valve assembly, take its weight into account!

Never lift the valve or control valve assembly by the positioner, the limit switch or their piping. Place the lifting ropes securely around the valve body (see Fig. 2).

Damage or personal injury may result from falling parts.

CAUTION:

Follow the proper procedures when handling and servicing Oxygen valves.

CAUTION:

Hexavalent chromium(VI) or Cr(VI), is known to cause cancer. Be sure to use all appropriate personal protective equipment (PPE) when welding metals containing chromium.

CAUTION:

Ensure that any weld splatter does not fall onto the valve trim. This may prevent proper trim movement or damage critical seating surfaces causing leaks.

CAUTION:

Make sure the valve is not pressurized when removing the actuator

CAUTION:

Potential electrostatic charging hazard. Ensure the protection in the process.

CAUTION:

Improper stud and nuts or any other parts are not to be used. Use of unapproved stud and nuts or any other parts may cause an accident which results in personal inquires and property damage.

2. TRANSPORTATION, RECEPTION AND STORAGE

Check the valve and the accompanying devices for any damage that may have occurred during transport.

The valve is delivered in the closed position. A valve equipped with a spring-return actuator is delivered in the position determined by the spring.

Store the valve carefully before installation, preferably indoors in a dry place.

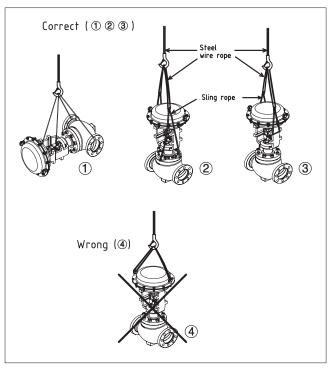

Fig. 2 Lifting the valve

Do not remove the flow port protectors until immediately before installation of the valve into the pipeline.

3. VALVE INSTALLATION

3.1 General

Remove the flow port protectors and check that the valve is clean inside.

CAUTION:

When handling the valve or the control valve assembly, take its weight into account!

NOTE:

Heat insulation should be installed when valve design temperature is over 260°C to protect actuator, positioner and accessories from heat.

3.2 Installation into the pipeline

Pipeline cleaning

Make sure no foreign particles, such as sand or pieces of welding electrode, are in the pipeline, they may damage the sealing surfaces.

Installation valve

The valve has an arrow indicating the flow direction. Install the valve in the pipeline so that the flow direction of the valve corresponds to the flow direction marked on the pipe.

The mounting orientation of the valve should be vertical position as it is shown on Fig. 3.

CAUTION:

Hexavalent chromium(VI) or Cr(VI), is known to cause cancer. Be sure to use all appropriate personal protective equipment (PPE) when welding metals containing chromium.

CAUTION:

Ensure that any weld splatter does not fall onto the valve trim. This may prevent proper trim movement or damage critical seating surfaces causing leaks.

NOTE:

For any other mounting position, please consult the factory.

Choose flange gaskets according to the operating conditions.

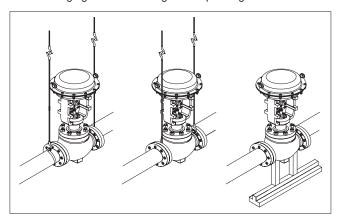

Fig. 3 Installing the control valve into pipeline using supports

Do not attempt to correct a pipeline misalignment by means of flange bolting.

Loads on the valve body from pipeline vibrations can be reduced by supporting the pipeline properly. Reduced vibration also increases the lifetime of the positioner.

Where necessary, you can support the valve by the body, using regular pipe clamps and supports. Do not fasten supports to the valve or flange bolting or to the actuator, see Fig. 3.

3.3 Hydrostatic testing and line flushing

When performing the hydrostatic test and flushing on the line, the control valve should not be used as an isolating valve. Ensure that the control valve is always in the open position before starting this process; otherwise, it may lead to valve and trim damage or failure of the seals. Flushing and hydrostatic test kits can be purchased from Valmet.

CAUTION:

Flushing trim kit should be installed in the valve (especially 'Tendril trim' application) to protect the original trim and the flow passages while the valve installation and line flushing. Unless this caution could result in unstable control, valve leakage and excessive noise.

3.4 Control valve assembly

Check all joints, piping and cables.

Check that the actuator stop screws, positioner and limit switches are calibrated. Refer to their installation, maintenance and operating manuals

3.5 Valve insulation

If necessary, the valve may be insulated. Insulation must not continue above the upper level of the valve body, see Figure 4.

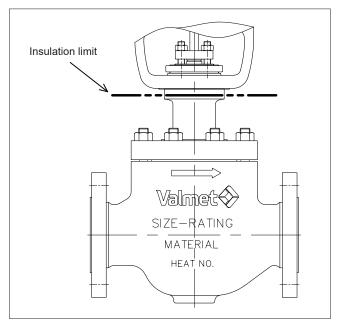

Fig. 4 Insulation of the valve

4. MAINTENANCE

CAUTION:

Observe the safety precautions listed in Section 1.7 before starting work!

CAUTION:

When handling the valve or the control valve assembly, take its weight into account!

4.1 General

The Neles Single Seated Globe valves require no regular maintenance. However, check the gland packing for leakage. This section outlines the maintenance that can be carried out by the user.

The numbers in parentheses refer to the parts lists and the exploded views of the valve in Section 9.

NOTE:

If you send the valve to the manufacturer for repair, do not dismantle it. Clean the valve carefully, including the inside. For safety reasons, inform the manufacturer of the nature of the medium when you send the valve.

NOTE:

Always use original spare parts to make sure the valve functions as intended.

4.2 Gland packing adjustment & bellows seal

In the event of a packing leakage tighten the hexagon nuts (18) in $\frac{1}{2}$ turn steps each until the leakage is stopped. Do not tighten more than necessary.

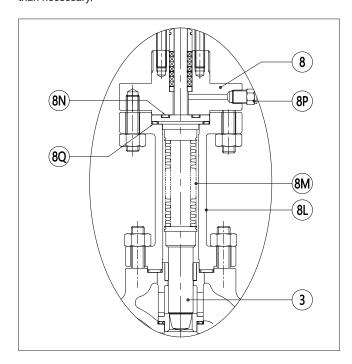

Fig. 5 Bellows seal construction

NOTE:

In case of the bellows seal bonnet construction, the gland packings are installed up at the top of the bellows bonnet(8L).

CAUTION:

Bellows assembly(8M) is welded with a the plug set. The bellows assembly should not be twisted.

CAUTION:

The bellows seal valve will be shipped from the factory with the plug (8P) inserted into the monitoring port.

Customers should connect their leakage detection system to this monitoring port to receive warnings in the event of a bellows seal leakage.

4.3 Replacing the gland packing

CAUTION:

Do not dismantle the valve or remove it from the pipeline while the valve is pressurised!

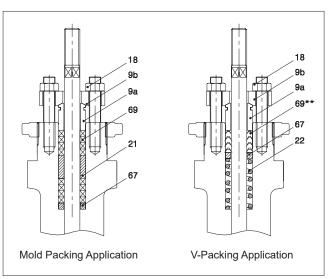

Fig. 6 Gland packing

- · Make sure the valve is not pressurised.
- Remove the actuator from the valve stem according to the instructions given in the actuator manual.
- · Loosen and remove the hexagon nuts (18).
- Remove the gland flange (9b), and gland (9a) up to the valve stem.

Table 1 Required torques for bonnet nuts

| Valve | Size | Rating (ANSI) | Bonnet Stud | Bolts | | l Torques lowable) |

| | | 2500 | 1-1/2"-8UN | 8 | 1400 | 1033 |

- Remove the old packing rings (69) using a pointed tool, avoid damaging the seal surfaces and valve stem.
- · Clean the packing ring counterbore.
- Mount the new packing rings one by one into the packing gland box using the gland as a tool and mount the gland with handtightened nuts.
- Each packing ring (69) shall be firmly seated into the stuffing box using the packing tamping tool.

CAUTION: Be carefull when using a hammer.

- Joints of successive braided type packing rings (69 & 69a if applicable) must be inserted 180 degrees against the previously inserted packing rings (69 & 69a if applicable).
- Apply lubricant which is suitable for the process type and temperature to the inner surface of the packing rings excluding PTFE packing and emission packing. (69)(& 69a if applicable). However, lubricant is not allowed for oxygen service or in any processes with temperature higher than 260'C(550'F).
- Apply lubricant suitable for process temperature to the gland studs (14) and nuts (18) properly. However, lubricants for special services which are flammable should not be used.
- Fasten the gland by tightening the hexagon nuts(18). Refer to the torque table to avoid over-tightening which may cause high friction and wearing.
- · Check leakage when the valve is pressurised.

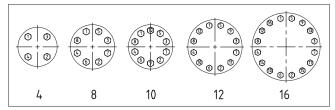

Fig. 7 Tightening sequence of the bonnet nuts

Table 2 Required torques for packing nuts

4.4 Replacing the trim and body reassembly

NOTE:

The trim set consists of the seat, plug and stem, retainer and gaskets (for seat and body).

- · Make sure the valve is not pressurised.
- Remove the actuator from the valve stem according to the instructions given in the actuator manual and Section 6.
- · Loosen the hexagon nuts (18) slightly.
- · Remove the hexagon nuts (17).
- · Remove the bonnet (8)
- · Remove the plug unit (2) and
- the retainer (10).
- Remove the body gasket (65), seat ring (7), seat gasket (63)

CAUTION:

Do not reuse the spiral wound gaskets (63 & 65), this is need to be replace each time the valve is disassembled.

- Remove the hexagon nuts (18), gland flange (9b) and packing gland (9a).
- Remove the old packing rings (69) (and optional lantern ring (21).

NOTE:

If the valve have excess leakage, the plug and seating surface need lapping and cleaning.

- Clean the body gasket surface.
- Insert a new seat gasket (63) and the seat ring (7) into the body.
- Install the plug set (2*) with the retainer (10) very carefully.
- · Insert the body gasket (65).
- Mount the bonnet on the body carefully maintaining alignment with the plug and the stem and with the retainer in the closed position, so that the arrow on the body and on the bonnet point in the same direction.
- Apply lubricant which is suitable for the process type and temperature to the studs(13), gland studs(14), hexagon nuts(17), nuts(18), stem(5) and thread area properly.
 However, lubricant is not allowed for oxygen service or in any processes with temperature higher than 260'C(550'F).
- Insert the bonnet nuts into stud bolts and slightly fasten the stud nuts

CAUTION:

Do not excessively tighten stud nuts at this time.

Insert the packing according to above 4.3

NOTE:

Guide Bushing Removal

The Guide Bushing (4) is a press and tag welded fit into the retainer and does not normally necessary replacement. If need, it may be machined out. When machining the bushing out, care must be maintain proper dimensions and tolerances.

CAUTION:

The all related parts (seat ring, retainer, plug & stem, bonnet) must be properly aligned in the body.

- Tighten hexagon nuts(17) according to the torque table to make proper contact between a plug and a seat ring.
- Fasten the glad by tightening the packing flange nuts according to the torque table.

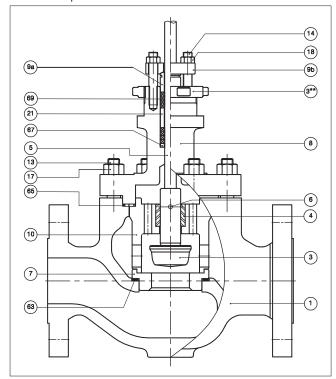

Fig. 8 Conventional Trim

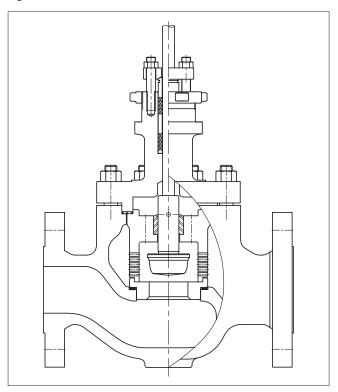

Fig. 9 Tendril Trim

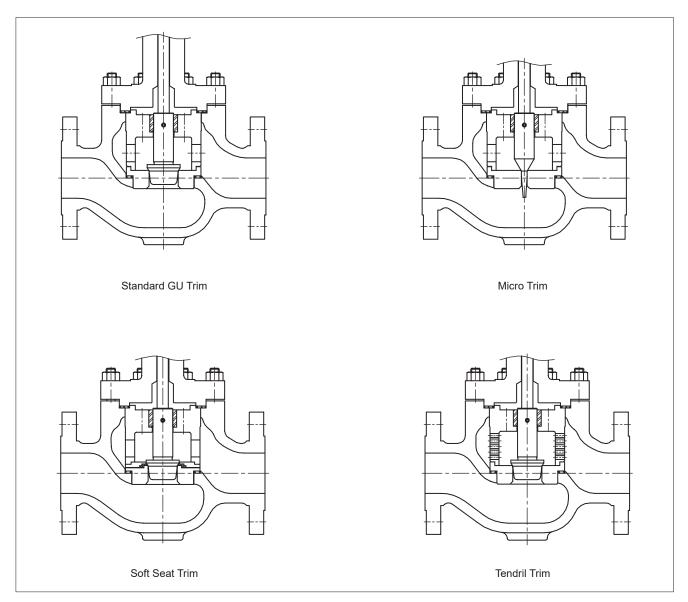

Fig. 10 Trim Design Applications

TESTING THE VALVE

CAUTION:

Pressure testing should be carried out using equipment conforming to the correct pressure class!

We recommend that the valve body is pressure-tested after the valve has been assembled.

The pressure test should be carried out in accordance with an applicable standard for the pressure rating. The valve must be in the open position during the test.

6. REMOVAL & MOUNTING THE ACTUATOR

Actuator is to be mounted on the valve assembly and is to be reconnected to the valve plug stem according to this manual. There are several types of actuators such as VDR/VDD diaphragm actuator, VBR/VBD spring return cylinder actuator and VBC/VCC

spring-less double acting cylinder actuator which requires different clamping. In this manual, VD actuator mounting and removal will be handled. For other types of actuator, please refer to separate IMOs.

CAUTION:

Make sure the valve is not pressurized when removing the actuator.

CAUTION:

Beware of the plug movement!

Do not use air pressure higher than what specified on the identification plate.

NOTE

Threaded area is required to apply lubricant suitable for process temperature to yoke nut(3**) and clamp(1**).

A. Actuator removal for Reverse <air to open, stem retract> actuator (Fig. 12)

- To prevent personal injury during dismantling, use compressed air to raise the valve plug approximately 20% from the seat ring.
 Failure to do so may cause clamps to spring out. This is because the actuator stem and valve stem are clamped together under pressure. Therefore, it is necessary to relieve the pressure by lifting the plug before disassembling the clamps.
- Loosen the stem locknut (5**) and socket head screws (1a**) and hexagon nuts (1b**).
- · Remove the stem clamp (1**).
- · Shut off and disconnect air supply line.
- · Support actuator with the suitable lifting device.
- Use compressed air to lift the valve stem, and then proceed to remove the yoke nut.
- · Remove the actuator from the valve body assembly.

B. Actuator removal for Direct <air to close, stem extend> actuator (Fig. 12)

- Before dismantling the clamps, it is crucial to disconnect the air supply from the actuator to prevent personal injury. Failure to do so may result in the clamps being forcefully ejected, as the actuator stem and valve stem are clamped together under pressure. Therefore, ensure that you remove the pressure by disconnecting the air supply before proceeding with clamp disassembly.
- Loosen stem lock nut (5**) and stem socket head screws (1a**) and hexagon nuts (1b**).
- Remove the stem clamp (1**).
- · Support actuator with the suitable lifting device.
- Use compressed air to lift the valve stem, and then proceed to remove the yoke nut.
- · Remove the actuator from the valve body assembly.

C. Actuator installation

Standard valve construction

- Using the handwheel or pneumatic pressure, lower the valve stem until the plug makes contact with the seat ring. Place a flat object between the valve stem and actuator stem when pushing them down to ensure proper contact between the plug and the seat ring. Ensure that the handwheel indication is in the neutral position before operating the valve pneumatically.
- 2. Employing the handwheel or pneumatic pressure, elevate the actuator stem to its fully retracted position.
- Align the starting point (0) of the ruler with the end of the retracted actuator stem.
- 4. By releasing compressed air, lower the actuator stem by valve stroke and clamp the valve stem and actuator stem together. The actuator stem is to be lifted up by Gap 1 (Gap 1 = Distance between the actuator stem end when fully extended and the actuator stem end when fully retracted valve stroke). This compression of the actuator springs in this manner can generate shut-off pressure (VDR) and open pressure (VDD) in the event of valve failure.

For more detailed information, please contact your Valmet sales office or service center..

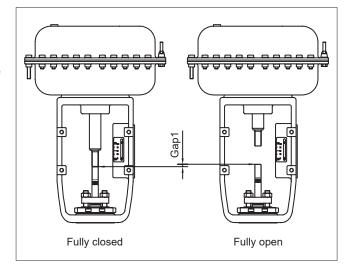

Fig. 11 Measurement of Gap 1

D. Installing VB, VC piston actuators

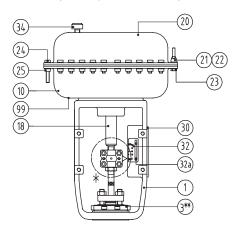

- VBD and VBR actuators are spring piston actuators for single acting. Please refer to its IMOs for further information
- VBC and VCC actuators are double acting piston actuators without spring. Please refer to its IMOs for further information

CAUTION:

Avoid to turn the valve plug and stem when plug is on seat ring to prevent the seating line from being damaged.

8. ORDERING SPARE PARTS

NOTE:

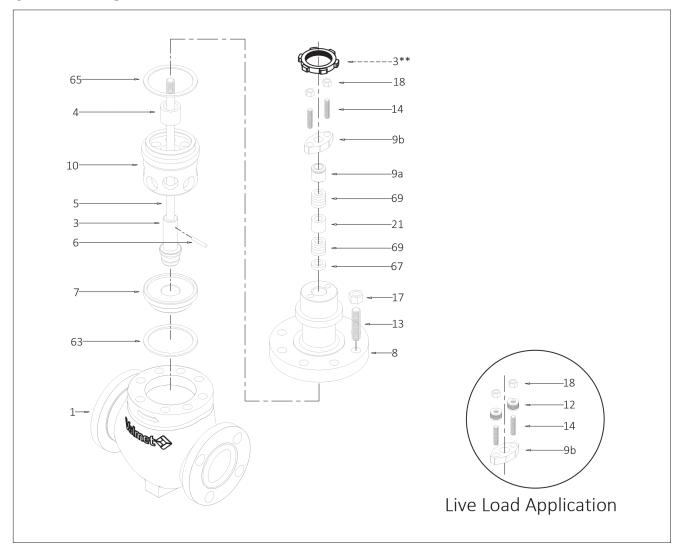

Always use original spare parts to make sure that the valve functions as intended.

When ordering spare parts, always include the following information:

- type code, sales order number, serial number
- number of the parts list, part number, name of the part and quantity required

This information can be found from the identification plate or documents.

EXPLODED VIEW AND PARTS LIST

NOTE P.C.D = Pitch Circle Diameter

DIN Valve (PN10-PN40)

Face to Face acc. to DIN 3202-1 / EN 558 series 1

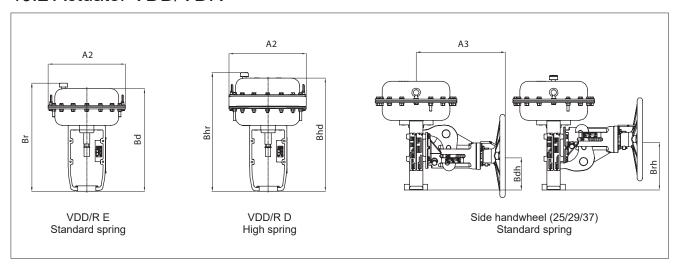

Flange acc. to EN1092-1 type 21

Dual material marking (ASTM & EN) will be available on pressure retaining parts.

e.g. A216 gr. WCB/1.0619, A351 gr. CF8M/1.4408

Manufacturer: Valmet Flow Control Korea Co., Ltd. Chungju, Chungbuk-do 27466

Korea

EU Authorised Representative: Valmet Flow Control Oy, Vanha Porvoontie 229, 01380 Vantaa, Finland. Contact details: +358 10 417 5000

This declaration of conformity is issued under the sole responsibility of the manufacturer.

Neles Globe valves Product:

G-series (GB, GM, GU, GW Type:

> ATEX group and category: (£x) II 2 GD, II 3 GD Ex GAS: Ex h IIC 85°C...Tmax Gb Ex DUST: Ex h IIIC T85°C...T(Tmax) Db

Tmax= valve max. temperature in name plate

Manufacturer's certificates:

| Standard / Directive | Notified Body and NoBo number | Certificate No. |
|--------------------------|--|--------------------------------|
| ISO 9001:2015 | LRQA (Certification body) | 10531829 |
| PED 2014/68/EU Module H | DNV Business Assurance Italy S.r.I. 0496 | 142306-2013-CE-FIN-ACCREDIA |
| ATEX 2014/34/EU Annex IV | DNV Product Assurance AS Norway 2460 | Presafe 18 ATEX 91983Q Issue 6 |
| | • | |

ATEX 2014/34/EU Annex VIII technical files are archived by Notified Body number 0537

The object of the declaration described above is in conformity with the relevant Union harmonisation legislation:

| PED 2014/68/EU | Valve |
|-----------------|--------------------------|
| ATEX 2014/34/EU | Non-electrical equipment |

Main components:

Valve:

The valve is suitable for service up to PED Cat III

Valve design standard: ASME B16.34

Installation, Maintenance and Operating instructions manual (IMO) must be followed before installation in order to ensure proper and safe mounting and usage of equipment.

The product above is manufactured in compliance with the applicable European directives and technical specifications/standards (EN10204). The product is in conformity with the customer order.

Instrumentation and accessories having equal protection concept, level and performance specification with the original can be presumed to be in conformity with this Declaration of Conformity.

Protection from e.g. static electricity caused by the process or connected equipment must be considered by the user (EN 60079-14 § 6). EN 60079-19 applies for modifications.

Non-electrical equipment is according EN 80079-37:2016 and EN 80079-36:2016. The actual surface temperature of non-electrical equipment is depended on the process and ambient conditions (EN 80079-36:2016 § 6.2.5 and 6.2.7). The protection from high or low temperature must be considered by the end user before put into service.

The product does not possess any residual risk according to hazard analysis conducted under the applicable directives providing that the procedures stated by the IMO are followed and the product is used under conditions mentioned in the technical specifications.

Documents with digital and/or e-signature conveyed by Valmet Flow Control conform to the Regulation (EU) No 910/2014 as well as the national code on e-signatures. In order to secure the integrity of the document, the authenticity of the sender, and indisputableness of the dispatch the identification is covered by individual ID codes, passwords, and by regularly changing passwords. The authorization to sign documents is based on organizational position and/or is task related. The impartial third party in the company bestows the access right with predefined authorities to particular databases.

⁻ Rated Cv is different depending on trim type and characteristic.

⁻ Str. : valve stroke length(mm). It should be matched with actuator stroke length.

13. GENERAL SAFETY WARNINGS AND DISCLAIMERS

General safety warnings

Lifting

- Always use a lifting plan created by a qualified person to lift this equipment. Lifting guidance is provided in this IMO (Installation, Maintenance and Operation manual) to assist in lifting plan development. Think about the point center of gravity (CG) of the equipment being lifted. Make sure the CG is always under the central lifting point.
- Valves may be equipped with lifting threads on the body or on the flanges. These are which are intended for use with the lifting plan.
- Use only correct and approved lifting devices. Ensure that lifting devices and straps are securely attached to the equipment prior to lifting.
- 4. Check, that lifting devices are not damaged and in good condition with a valid check stamp prior to use.
- 5. Workers must be trained for lifting and handling valves.
- 6. Never lift an assembly by the instrumentation (solenoid, positioner, limit switch, etc.) or by the instrumentation piping. Straps and lifting devices should be fitted to prevent damage to instrumentation and instrumentation piping. Failure to follow the lifting guidance provided may result in damage and personal injury from falling objects.

Work activities on the valve

- Wear your personal safety equipment. Personal safety equipment includes but is not limited to protective shoes, protective clothing, safety glasses, helmet, hearing protection and working gloves.
- Always follow the local safety instructions in addition to the Valmet instructions. If Valmet instructions conflict with local safety instructions, stop work and contact Valmet for more information
- 3. Before beginning service on the equipment, make sure that the actuator is disconnected from any kind of power source (pneumatic, hydraulic, and/or electric), and no stored energy is applied on the actuator (compressed spring, compressed air volumes, etc.). Do not attempt to remove a spring return actuator unless the stop screw is carrying the spring force.
- Make sure that there is a LOTOTO (Lock Out / Tag Out / Try Out) procedure in place for the system in which the valve is installed and strictly follow it.
- Always make sure that the pipeline is depressurized and in ambient temperature condition before maintenance work is started.
- 6. Keep hands and other body parts out of the flow port when the valve is being serviced and the actuator is connected to the valve. There is a high risk of serious injury to hands and/ or fingers due to malfunction if the valve suddenly starts to operate.

General disclaimers

Receive, handle and unpacking

- 1. Respect the safety warnings above!
- Valves are critical components for pipelines to control high pressure fluids and must therefore be handled with care.
- 3. Store valves and equipment in a dry and protected area until the equipment is installed.
- Keep the original packaging on the valve as long as possible to avoid environmental contamination by dust, water, dirt, etc.

- Remove the valve endcaps just before mounting into the pipeline.
- FOR YOUR SAFETY IT IS IMPORTANT THE FOLLOWING PRECAUTIONS BE TAKEN PRIOR TO REMOVAL OF THE VALVE FROM THE PIPELINE OR BEFORE ANY DISASSEMBLY:
 - Be sure you know what fluid is in the pipeline. If there is any doubt, confirm with the proper supervisor.
 - Wear any personal protective equipment (PPE) required for working with the fluid involved in addition to any other PPE normally required.
 - Depressurize the pipeline, bring to ambient temperature, and drain the pipeline fluid.
 - Cycle the valve to relieve any residual pressure in the body cavity.
 - After removal but before disassembly, cycle the valve again until no evidence of trapped pressure remains.
- The identification plate (nameplate, or engraved markings) on the valve gives the information of max. process conditions to the valve
- Temperatures and pressures must never exceed values marked on the valve. Exceeding these values may cause uncontrolled release of pressure and process fluid. Damage or personal injury may result.
- Valmet valves typically are designed to be used in atmospheric conditions. Do not use valves under external pressurized conditions unless specifically designed and explicitly marked for this service.
- Avoid Pressure shocks or water hammer. Systems with high pressure valves should be equipped with a bypass to reduce the differential pressure before opening the valve to avoid pressure shock.
- 11. Avoid thermal shock. High temperature, Low temperature and cryogenic valves should be operated in a way that limits the rate of increase or decrease in temperature. The valve should be thermally stabilized before being pressurized.
- 12. Materials of the valve are carefully selected for the process conditions. Changes to the process media can have a major impact on function and safety of the valve. Always confirm the materials are suitable for the service prior to installation.
- 13. As the use of the valve is application specific, a number of factors should be taken into account when selecting a valve for a given application. Therefore, some situations in which the valves are used are outside the scope of this manual.
- 14. It is the end user's responsibility to confirm compatibility of the valve materials with the intended service, however if you have questions concerning the use, application, or compatibility of the valve for the intended service, contact Valmet for more information
- 15. Never use a valve with enriched or pure oxygen if the valve is not explicitly designed and cleaned for oxygen. Selected materials and design have a major impact on the safety to operate the valve with oxygen.
- Valves intended for use in or with explosive atmospheres must be equipped with a grounding device and marked according ATEX (or equivalent international standards).

Maintenance

- 17. Respect the safety warnings above!
- 18. Plan service and maintenance actions, that spare parts, lifting devices and service personnel is available.

- Maintain the valve within the recommended minimum maintenance intervals or within the recommended maximum operating cycles.
- Always make sure that the valve and the pipeline is depressurized before starting any kind of maintenance work at a valve.
- Always check the position of the valve before starting maintenance work. Follow the Lock out /tag out (LOTO) rules at the site before starting any maintenance activity.
 - · See IMO for the correct stem position.
 - Consider that the positioner may give the wrong signals.
- 22. Sealing materials (soft sealing parts) should be changed when the valve is maintained. Always use original equipment manufacturers (OEM) spare parts to ensure proper performance of the repaired valve.
- All pressure containing parts must be inspected visually for damage or corrosion. Damaged parts must be replaced.
- 24. Valve pressure bearing parts and all internals must be inspected for corrosion or erosion which may result in reduced wall thickness on pressure bearing parts. Damaged pressure bearing parts must be replaced with original equipment manufacturer's (OEM) replacement parts or repaired to factory specifications by an authorized Valmet service partner in order to maintain the warrantee.
- 25. Do not use sharp tools, grinding machines, or files to work on functional surfaces such as sealing, seating or bearing surfaces as this can damage these surfaces.
- Do not weld on pressure bearing parts without an ASME and PED qualified procedure and personnel.
- Pressure bearing parts of valves in high temperature applications must be carefully examined for the effects of material creep and fatigue.
- Make sure that the valve is positioned in the correct flow direction into the pipeline.
- 29. If the valves are marked to be suitable for explosive atmospheres, the correct function of the discharging device must be tested before returning to service.
- 30. Always work in a clean environment. Avoid getting particles inside the valve due to machining, grinding, or welding nearby.
- 31. Never store a maintained valve without flow port protection.
- 32. When pressure testing valve seats, never exceed the maximum operating pressure of the system or the maximum shut-off pressure marked on the valve identification plate.
- 33. Actuator mounting and unmounting:
 - Before installing the actuator on to the valve, be sure the
 actuator is properly indicating the valve position. Failure to
 assemble these to indicate correct valve position may result
 in damage or personal injury.
 - When installing or removing a linkage kit, best practice is to remove the entire linkage assembly, including couplings which may fall off the valve during lifting or when position changes.
 - Mounting sets have been designed to support the weight
 of the Valmet actuator and recommended accessories.
 Use of the linkage to support additional equipment or
 additional weight such as people, ladders, etc. may result in
 equipment damage or personal injury.

- 34. The valve should be installed between flanges using appropriate gaskets and fasteners that are compatible with the application, and in compliance with applicable piping codes and standards. Center the gaskets carefully when fitting the valve between the flanges. Do not attempt to correct pipeline misalignment by means of the flange bolting.
- 35. Repairs on valves for special service like Oxygen, Chlorine, and Peroxide, have special requirements.
 - Parts must be cleaned appropriate to the service and protected from contamination prior to assembly.
 - Assembly areas and tools must be clean and dry to prevent contamination of the parts during assembly.
 - Test equipment must be clean and dry to prevent contamination during testing. This includes the test equipment internals that may allow particles or other contamination into the test fluid during the test.
 - Lubrication shall be used only if specifically required in the instructions. Where lubrication is required, the lubricant must be approved for the service by the end user.
